if you dug up a sewing machine for some quarantine crafting, now is a terrible time to drag it into a repair shop if something goes wrong. Fortunately, many of the common sewing machine glitches things that you can fix yourself in just a few minutes. I love this checklist from the blog She's a sewing machine mechanic; As a veteran artisan I can attest that I am faced with several of these challenges and these suggestions often work. Read this list for more information, but here's the top takeaway: Adjust the flow and bobbin tension If the stream keeps the ligaments up or if the stitching just looks wrong, chances are something too tight. The standard sewing machine uses two strands: one that spins from the coil on top of the machine and passes through the needle, and one that comes from the tiny coil at the bottom. When the machine is adjustable properly, these two strands wrap around each other to create each stitch. If one of these threads is tougher than the other, it can pull the resulting stitch out of the impact. For example, if the bottom of the fabric looks like one dense stream with a bunch of loose little loops running around it, either your bobbin thread is too tight or your top stream is too loose. So check both streams. Will you drive the top thread through all the places it should go when you are carving the machine? Do you properly load the bobbin? If both of them seem normal, check the voltage settings for both threads. The top thread will have a voltage selector- often a handle on the front of the machine. The strain of the bobbin filament is usually adjusted by the screw on the bobbin body (righty-tighty, lefty-loosey). Check your needle needle should be straight, sharp (usually) and set correctly if you want to do your job. Make sure it doesn't bend and replace it if you can't remember when you last changed it. One side of the needle is flat, where you attach it to the machine; Usually this side should be back to back, but it depends on your machine. If in doubt, check the manual. Different fabrics require different needles, so make sure you use the right one. Machine needles come in different sizes and some are sharp while others are ballpoint. It's hard to tell just looking if you're not familiar, so check out the package. If the machine continues to pass the stitches, there is a good chance that you are using the wrong needle. Here's a guide to choosing the right one. Make sure the settings will allow you to sew if the machine won't sew at all, you've probably forgotten to flip the switch somewhere. First, check the obvious things: is it on? Is the pedal connected? Is the press foot down? If the machine buzzes and whirls but the needle doesn't move, you can have your bobbin dilapidation on. It's a feature that lets the machine wind the bobbin engine for you, and it deactivates the entire sewing machine while you're doing Look for the switch. In the old car, turn the wheel that is inside the hand On the side of the car. If the needle is moving and the tissue is not, check the dog foot. It's the spiky bars under the needle that move to slide the fabric together as you sew it. There is a switch that turns them off; You may have hit it by accident, so just turn it back on. Actually clean the darn thing There there are still a few things to check out in the guide, but we've gone through a great one. And the last thing to consider: If the machine works more or less well, but just acts a little weird sometimes, clean it up! Open the bobbin case and any other area that is quite accessible, clean the lint and apply a few drops of machine oil, as the manual instructs. It's mineral oil; it's not WD-40. If all else fails, you may end up needing to call the repair shop or get really in-depth with YouTube sewing machine repair videos. But in most cases, the wrong machine will do its job just fine once you make sure everything is set up correctly. Spruce/Debbie Colgrove Your sewing machine guide is the best place to learn how to thread a sewing machine, but if you want to get started and don't have the manual of your machine, the basics of threading the sewing machine can get you started. When threading a sewing machine, be sure to thread them with the press foot up. When the foot of the press is in an upward position, the tension is released, which allows the thread to sit properly. You can check the difference by pulling the thread on the needle with the foot press up and with the foot of the press down-thread will pull smoothly if sitting properly. I've always wanted to see how the insides of the sewing machine worked.... In a box of old things heading to the ground to fill was an old singer, so that's what I did. All I have to say is ya gotta love plexi glass. You'll need a few things; All the things I used were just leftovers from other projects. If you have leftovers too, then yippee for you! Well, however you manage to get the things you need.. A sewing machine (check around you should be able to find an old dust collection some place for pretty cheap, or perhaps free!! or you may already have one that is worthy of a small hack. B, Plexi Glass, if you don't have it yet you can get it from any major hardware store like Lowes or Home Depot. (I like Lowes better than myself). A large enough piece should not be larger than about 10 or 15 bux in a pinch. C, hot gun glue and glue sticks. ... You can use silicone glue or epoxy resin, but glue sticks set quickly and cheaply. D, paper of some kind (for stencil shapes you'll cut out of plexi-glass). I used a piece of contractor's paper, but a printer paper or an old paper bag, whatever worked. Along with the paper, you will need to write utensils. I used Sharpie. I like my Sharpie, he doesn't E, several flat-headed propeller drivers. (to open the machine) F; the last, but equally important, wonderful tool known as the Dremmel Tool. (and cutting drives) now you take the take screwdriver and you'll notice two or three screws on top of the sewing machine (at the mine they were sunk about an inch down.) and then gently lift the upper body up and away from the thing. You can also decide how I did to remove the piece that goes just above the needle. (The one I disassembled with just one screw to hold this piece because it is removed to replace the light bulb that on my model is placed inside this part) this old machine also had a separate part that covered the belt-drive and pulley, so I pulled it out too (because I figured why not put a box in it too). Okay, now before we get going I have to say this plastic tends to spit almost microscopic specks of molten plastic shrapnel up and away from the cutting tool. This plastic also smells of cancer, so you can wear a dust mask or respirator before you start cutting through the plexi glass and old body parts, and safety glasses would probably be a good idea as well. Now that you decide to breathe in the plastic dust and get an itchy eye... ( I see your brash self not wearing a dust mask or glasses, I know your look; I was once like you. . . . just last night when I did this hack.) Before you just start getting happy with chop-chop'ity, cutting, make sure you've checked to see your particular machine where the best places to cut may or may not be. Once you've figured out where the cut go on it.... Then use the holes that you have cut as patterns for plexi glass. Use paper and marker and just trace the shapes you need, then transfer the pieces to the plexi glass, placing them over the paper. When in doubt, cut the shape of Lii' too big and then widdle it back to a better fit.... hay, I think the name of this step spells out it, so go to it. OK, now warm up the glue gun and keep Dremmel plugged in for any minor adjustments... Put the hot glue around the edges to cut the part of the body as needed and then before it can cool to put the plexy in place. I'd say it's best to start with one big piece that goes on top, but that's just me. I glued one edge first in the style of tack welding. Then when I knew he posted where I wanted him I locked it more tightly, I then put in smaller bits and adjusted em' to fit the tighter once you have all the windows where you want to collect all the body parts and find the right screws for each piece, and admire your work and look with surprise at the hours of work movement parts inside the sewing machine. As you look out the window you install ya 'gotta love like Plexi-glass and Dremmel tool. Bernina Some links in this article may be temporarily unavailable due to a shortage of coVID-19 outbreaks. We will keep this article updated with updated links as products come available. The Institute of Household Textiles Lab has reviewed hundreds of machines to find the best styles for your home sewing projects, whether you like embroidery, quilted, making clothes, or sewers want to learn. These heavy machines will help take your sewing skills to the next level. When buying a sewing machine, the deciding question to ask yourself is: What is the most important thing for me when I sew? Machines come with lots of different add-ons, accessories and features that may not be relevant to you and just add unnecessary costs, while other features that you can't sew without. Here are some features to look at before shopping: Number and styles of stitches are offered: For beginner sewers, you only need two stitches: straight and zigzag. More experienced sewers should look for a wider range. For example, if you like embroidery or quilted, make sure you are looking for machines that provide these features: If your machine does not offer embroidery or free sewing motion, these features cannot be added later. Also, make sure the machine has the ability to adjust the length of the stitch, the zigzag width and the voltage so that you have more control over the stitching. Included accessories: Most machines include bobbin and press legs, but some of them include much more. For most bang for your buck, check if the machine includes zippered feet, leg loops, leg embroidery, a removable extended desktop, and storage area. Additional features: Some machines include specific features that can make sewing a lot easier, like carving cutter, automatic needle carving, lights, free hand, blind stitching, and looping capabilities. If you have them, sometimes you can't imagine sewing on a car without them. Frame design: For the durability of the machine, you want to look for a metal frame option. Plastic frames are common, but can get worse faster and be more difficult to repair. As with all sewing machines, make sure to read the included manual carefully before sewing, since each machine has slightly different use and grooming instructions. Then stitch off! Advertising - Continue reading below The Best Overall Sewing Machine Innov is the NS80E Sewing Machine Brother sewingmachinesplus.com \$499.00 This computerized brother sewing machine is popular for offering many interesting features by being an easy-to-use machine. This machine has 80 built-in stitches and eight styles of one-step loops, so you can personalize your sewing designs with ease.
