This site is not available in your country Yes, crabs lay eggs. There are many species of crabs, but their reproductive activities are similar. Female horseshoe crabs lay between 60,000 and 120,000 eggs. Horseshoe crabs breed in the spring. They migrate to sandy flats during high tides, where they mate and lay eggs. Male horseshoe crabs walk up and down the beaches waiting for female crabs to arrive. When the female crab comes to shore, the male attaches to the back of the female, using specialized legs called pedipalps. The female crab then digs out the nest in the sand and the male fertilizes the eggs as she throws them into the nest. Females can lay a few paw eggs each season. It will take eggs two to five weeks to hatch. Baby horseshoe crabs are in a larvae state when they appear. If you keep chickens, you would naturally prefer to have your chickens-carrying lay eggs in the nest boxes you have provided for this purpose rather than outside on the ground, in corners hidden in tall grass, in bales of hay, or any of the hundreds of other places that seem to appeal to them. It's a crazy fact of life for chicken keepers that chickens often resist cooperating when it comes to laying eggs. Chickens are creatures of habit and they can be very stubborn about this behavior. But don't give up. There are several ways you can encourage chickens to lie in their nest boxes, ensuring that you get the maximum amount of fresh, clean eggs. One box for every four to six chickens is perfect for your chickens to feel comfortable lying in them. Paradoxically, too many nest boxes will cause chickens to use them to sleep and defecate, but are less likely to lay eggs in them. Make sure your nest boxes are in the dark, quiet corner of the coop. Chickens have an instinct to lay eggs in a safe place. The boxes should be at least a few inches from the floor. Make sure to collect eggs regularly, since the box is already full of eggs not very attractive for the chicken looking for a nesting place. One or two eggs already in the box won't dissuade the chicken from adding a few more, but most chickens attract an empty nesting box, provided they are clean and attractive. If you get into the habit of collecting eggs twice a day, there is a good chance that your chickens will seek to fill these empty spots with lots of eggs. Ideally, you want your chickens to lay eggs in nest boxes rather than use them as a home. If nest boxes are their only place to sleep, the boxes will quickly become dirty with faeces, leading to dirty eggs. But if you provide enough roosting spots, chickens are more likely to sleep on roosts and reserve boxes for laying eggs. You can purchase fake ceramic eggs from feed or supply stores, or use a golf ball. As your pulleys are preparing to start laying, posting The egg in the nest box will give them a hint that the boxes place to lay eggs, too. If the chicken has chosen the wrong nesting spot in which to lay eggs, try blocking it or making it otherwise different to her. The ground area may simply be covered with a piece of wood or other object. In other areas, stones or plastic bottles piled on her forbidden nesting spot may be all it takes to convince her to return to the comfortable nesting window you provided. Most chickens lay early eggs a day. Keeping them in the coop until most of the egg laying is done, you maximize the chances that they will lie in the nest box instead of finding a cozy place in the yard outside the coop. As shavings or other bedding materials are depleted in nests, chickens tend to avoid them. Keep the shavings or straw in the nest boxes nicely and fluffy and change it regularly to encourage the chickens to lie there in the nest boxes and not elsewhere. It takes some careful observation, but if you see your chicken settle in an illegal nesting spot, you can gently but persistently grab it and move it into an empty nest drawer. Sooner or later, she gets tired of being broken and start heading right to the available nest box when the spirit says it's time to lay. Chickens naturally stop egg production when daylight hours are reduced in winter. Not only will they stop laying eggs in nest boxes, but they also won't put off much at all, anywhere. You can stimulate egg production by increasing with artificial lighting so that chickens get at least 14 hours of light each day using a combination of natural daylight and artificial light. Chickens that develop the habit of sleeping in their nesting boxes often refuse to lay eggs there, perhaps out of an innate sense of hygiene. When you notice the chickens settle down to sleep in nesting boxes rather than roost, drive them away, or physically grab them and place them on roosts. It is not uncommon for female birds to lay eggs without a male bird present. If you find an egg in your parrot's cage, you're probably wondering how it happened, what to do with it, and whether it will hatch. If you have a female bird, nature requires that she lay an egg from time to time, but that doesn't necessarily mean that you're going to see a baby bird or that an egg will hatch. If the chicken has been exposed to male birds before eggs or eggs have been laid, the egg will not be fertile. In this case, most bird owners remove the egg from the cage and throw it away. Most of the time, chickens return to their usual routine. There is no need for the male bird to be present at the female bird to produce eggs. Similarly, as females ovulate approximately every 28 days, female birds must release their eggs whether or not they are fertilized. In fact, if age breeding chickens do not lay eggs regularly, they are at risk for binding eggs, a potentially fatal health condition. Egg binding is a disease that affects female birds, they are unable to pass, or lay, an egg that has formed internally. This condition is common and can lead to infection or internal organ damage to the bird if not addressed. Depending on where settled in the bird's body, sometimes it can be broken at the same time inside the chicken. Sometimes an abdominal chicken massage can help the egg pass safely, but in other cases you may need to look for a certified bird veterinarian to help with displacing the stuck egg. If the egg is broken at the same time inside the chicken, any shell fragments or residues should be removed to prevent infection, and its egg - the bird's equivalent of fallopian tubes - should be cleaned by a professional. If there is a chance that your pet bird's egg is laid fertile and you want to raise a baby bird, you need a candle egg to see if it has really been fertilized. Candling is a process where bright light is held behind an egg to illuminate its contents without cracking it open. The bird breeder can determine whether the egg is fertilized based on the color, shape and opacity of the contents. If you find that an egg in your pet's cage has been fertilized, you will need to either return it to your mother for incubation or place it in an incubator if the chicken won't sit on it. If you suspect that your pet is ill, call your veterinarian immediately. For health issues, always consult your veterinarian as they have inspected your pet, know the animal's health history, and can make the best recommendations for your pet. SisojeGetty Images Ask Experts: Our expert panel answer questions about DIY, eco-design, mortgage, cleaning, architecture, consumer questions and more question: As the weather gets warmer, we want to hold a few updates in our garden. How hard is it to lay a wooden deck? DIY expert, Joe Behari, says: 'In theory it's not a hard job, but you have to be confident in power tools and cutting wood. Rent a circular saw from a tool rental company and read the instructions. Wear safety equipment when using it and practice first on a couple of rough cuts. Start by creating a base for flooring to sit on using 2in x 4in processed wood. Cut each joist to the desired size and screw together with galvanized screws to make the frame. It sits on the ground, providing a roll of the surface for the boards to fix and stops them in contact with the ground and becomes wet. Once the frame is built, cut out the flooring boards: they must be fastened perpendicular to the frame. But before you start cutting, think carefully about where to start and how to lay the deck. It may be a good idea to sketch out a plan so you know exactly how many boards you need and their correct length. Then lay out the boards before fixing them in order to make sure that they are all suitable and make any adjustments. To fix them on Make sure you screw them into the frame. You will need a countersinking tool on the drill as the screws have to sit right under the surface of the tree so they don't travel hazards. Countersinking tools either come with drill drill Attached or may be a separate bit in general that you use after taking the original hole. Use galvanized screws to fix each board, positioning two screws at each end of the board. Make this task easier on your hands by using an electric screwdriver or screwdriver bit on the drill.
